

BizStream Full-Stack Assignment

This assignment's purpose is to provide BizStream with an example of an applicant's skills and capabilities as a full-stack developer.

What are we looking for?

We would like potential applicants to create a simple "Contact us" form that saves a copy of the responses to a file in the root directory of the application. This can be accomplished in many different ways, and we'd love to see how you tackle it! Want to do it completely in C# MVC? Or maybe you're more comfortable with a SPA front end with an API backend? The world is your oyster.

What are the requirements?

This Contact us form will have the following 4 fields:

1. First name
2. Last name
3. Email
4. Message

The first name, last name, and email fields will be text inputs, with the message being a text area. Be sure to add validation to the email field to make sure it's a valid email address, and prevent the form from submitting until a valid email address is entered.
